

# AGRO IT<sup>®</sup>

advanced farm management

We believe that the deployment of IT is the next step forward which will change farming and enable the transition to higher quality and higher efficiency farming.

## MAIN TARGET USERS:

- farmers,
- agricultural organisations,
- and government and EU institutions from the area of agriculture.

AgroIT is an EU funded project that will implement an open platform based on open standards. In the last decades farming has been witnessing the deployment of various sophisticated technologies in the area of machinery and automation. We believe that the deployment of IT is the next step forward which will change farming and enable the transition to higher quality and higher efficiency farming. An increase in EU and national regulations, such as cow registers, FADN, etc., already demands significant level of bureaucracy from farmers.
